Summary

Software engineer with 4+ years of experience building backend services, event-driven systems, REST APIs, and cloud-native applications across recommendation platforms, supply-chain monitoring, and internal engineering platforms. Hands-on with Java, Go, TypeScript, AWS, Kafka, MongoDB, CDC pipelines, Kubernetes, and observability. Delivered production automation and platform improvements that reduced operational effort and improved data lifecycle management, API capabilities, and system visibility.

Technical Skills

Languages: Java, Go, TypeScript, JavaScript, Python
Backend: REST APIs, Microservices, Event-Driven Architecture, Node.js, Spring/Java Services, OpenAPI, API Design
Cloud & Messaging: AWS Lambda, ECS, EC2, EKS, S3, Step Functions, SQS, SNS, Kinesis, Kafka
Data: MongoDB, PostgreSQL, Change Data Capture (CDC), Debezium
Observability: OpenTelemetry, Datadog, Distributed Tracing, Metrics, Structured Logging, Trace Correlation
DevOps & Testing: Docker, Kubernetes, Pulumi, Terraform, GitHub Actions, CircleCI, JUnit, Karate, Unit Testing, Integration Testing

Experience

Accenture Jan 2022 – Present
Application Development Senior Analyst

- **DISCO – Supply Chain Monitoring:** Developed and maintained backend services and cloud-native integrations using Java, Go, Node.js/TypeScript, AWS, MongoDB, Kafka, and microservices for event-driven supply-chain monitoring and operational workflows.
- Contributed to a Java-based **Change Data Capture (CDC)** service that streams MongoDB changes to designated AWS Kinesis streams; led the **Java 17 upgrade** and migration of Debezium to a newer stable version to modernize the service and improve maintainability.
- Designed and implemented an automated data-archiving workflow using **AWS Step Functions and Amazon S3** to transfer historical MongoDB data, reducing an active collection load by approximately **1.8 million records** and saving approximately **20 hours of manual effort every three months**.
- Built a reusable **backfilling API** to automate data-correction workflows, replacing repeated manual script execution and saving approximately **20 hours of manual effort per backfill**.
- Designed and developed a **Tags API** supporting global, group, and individual tagging during product launches and hypercare, including tag creation and deletion; evolved the processing architecture from AWS Lambda toward **Amazon ECS with SQS-based message consumption**.
- Developed a Go-based **Audit Connector** deployed on Amazon ECS to consume audit events from Kafka, deserialize binary **Protocol Buffers**, transform payloads into JSON, and publish messages to Amazon SNS for downstream integration.
- **O-Series – Tax Configuration:** Developed **REST V3 APIs** for Taxability Drivers and Taxability Mappings, implementing OpenAPI contracts, controller/service layers, request/response mappings, authorization, validation, audit logging, and automated unit and integration tests.
- Implemented Taxability Mapping APIs for creating and retrieving configuration records, including reusable resolution of parties, taxability categories, drivers, tax impositions, flex fields, and filing categories with customer/vendor data caching.
- Designed and implemented a reusable **AST-based filtering framework** for REST V3 APIs supporting AND/OR expressions, parentheses, equality, IN, and contains operators, enabling consistent filtering across configuration endpoints.
- Contributed to O-Series configuration capabilities spanning **Taxability Drivers, Taxability Mappings, Flex Fields, Customer, and Vendor** workflows, resolving API-contract, validation, identifier, and data-model consistency issues.
- Contributed to application observability using **OpenTelemetry and Datadog**, including shared Java telemetry capabilities, dependency and build management, structured logging, distributed tracing, metrics, and trace/log correlation.
- **RECS – OTT Recommendations Platform:** Contributed to Top 10, Recommended for You, YAML-based configurations, data pinning, and hero-banner features using **Java, Go, AWS, and microservices**, supporting recommendation experiences across the platform.
- Contributed to the transition from **Amazon ECS to Amazon EKS** and from **CircleCI to GitHub Actions**, supporting modernization of Kubernetes deployment and CI/CD workflows.
- **Full-Stack Platform Engineering:** Redesigned a monitoring interface using **Go, HTMX, Tailwind CSS, and JavaScript**, moving selected data retrieval to server-side database access and using partial-page updates to reduce unnecessary API calls.
- Re-architected application session management by migrating from `icza/session` to `alexedwards/scs`, addressing security concerns in the authentication flow and supporting **SAML 2.0 and OAuth 2.0** requirements.

Education

Indian Institute of Technology (IIT) Bhubaneswar 2021
Bachelor of Technology in Mechanical Engineering
